

Farm to Feed Shopping Basket Recommendation Challenge

This repository contains the notebooks and scripts required to generate model predictions and produce the final competition submission.

Step 1: Generate Base Model Predictions

Run the following notebook to create prediction files from individual models:

Notebook: `Improved_approach_farm_prediction.ipynb`

This will generate the following output files:

- `cat_balanced.csv` — CatBoost model predictions
- `lgb_balanced.csv` — LightGBM model predictions
- `ens_balanced.csv` — Ensemble model predictions

Make sure these files are saved in the project root (or the expected output directory) before proceeding to the next step.

Step 2: Create Final Submission File

After generating the prediction files, run the final submission notebook:

Notebook: `Submit_Final_farm2feed.ipynb`

This notebook uses the outputs from Step 1 to create the final competition submission file in the required format.
